

ACCESS BRIDGEWORKS' SNOOPER TRUCKS

Access Bridgeworks (ABW) owns and operates two Paxton Mitchell under-bridge snooper trucks. We provide snooper truck rentals to assist asset owners, engineering consultants, and contractors completing bridge inspections, maintenance, repairs, and utility installation.

Snooper trucks provide a fast and maneuverable alternative to both scaffolding and rope access. These specialized units use telescoping and rotating booms to position a work basket beside or beneath a bridge within minutes.

Our larger unit features a telescoping basket capable of reaching the underside of a bridge deck on structures with deep girders.

Both of our snooper trucks operate within a single traffic lane and are equipped with rolling stabilizers. This allows the unit to move along the bridge deck while the work basket remains positioned beneath the structure. Both units have a 600 lb basket capacity.

We provide a working basket operator to assist with inspections, maintenance, or repair activities.

MARK IV SNOOPER TRUCK

Our Mark IV is the largest available truck in Western Canada. The unit provides 70 ft of vertical reach and 64 ft of horizontal reach below a bridge deck. Its main boom rotates 360 degrees to allow full access under a bridge. Despite its size, the Mark IV is versatile and able to fit through tight truss structures.

The Mark IV is ideal in situations where increased coverage of the bridge and maneuverability are required.

The Mark IV's versatility is ideal for:

- Detailed bridge inspections
- Accessing the deck soffit between deep girders
- Accessing piers well below the bridge deck
- Maneuvering through truss members
- Required access both above and below the bridge deck

SERIES 140 SNOOPER TRUCK

Our Series 140 snooper provides 22 ft of vertical and 43 ft of horizontal reach beneath a bridge. The Series 140 comes equipped with two basket options: a T-basket and a working platform.

The T-basket is 12 ft long and shaped like a Tee. The wider portion of the basket is positioned at the work area, allowing multiple users to stand and work side-by-side.

The working platform is 16 ft long and can extend to 28 ft long. This basket provides more horizontal reach and is ideal for completing repairs along the face of an element, such as a pier cap.

These basket options make the Series 140 ideal for:

- Detailed bridge inspections
- Concrete and bridgerail repairs
- Netting a bridge
- Working on utilities along the outside of the bridge
